Arailym Uali 200103467

This is the second part of developing ecommerce site.If before I have created login in page and searching items.On the second part I'm working on adding new products , editing them, delete, giving comments and ratings for them. Also I have worked on design of the site.
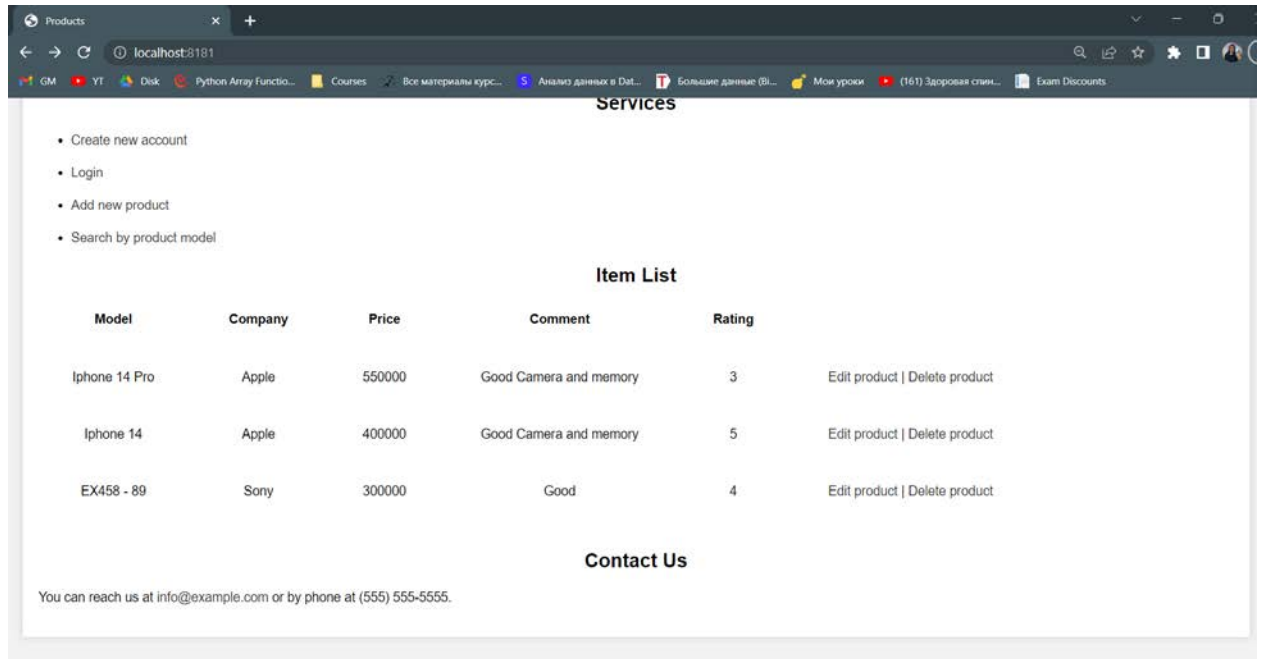

- Download all

```
        github.com/go-sql-driver/mysql v1.7.0 // indirect
        github.com/gorilla/context v1.1.1 // indirect
        github.com/gorilla/securecookie v1.1.1 // indirect
        github.com/gorilla/sessions v1.2.1 // indirect
        github.com/mattn/go-sqlite3 v1.14.16 // indirect
        golang.org/x/crypto v0.7.0 // indirect
```

- Go run main.go

Here we Im create the page for adding new item. Here we can add model,company,price,comments and rating.

The next page is about main page where all items are listed. And near them are Edit and delete buttons.

If you choose edit next to every item ,there is information about it.You can change everything then publish again because here im use the update statement as sql query.

The next is delete button, its function is to delete whole product from the list and database.
